

1. What is the name of the process that a computer uses to execute a program?
 - a. The operating system
 - b. The processor
 - c. The compiler
 - d. The interpreter
2. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?
 - a. The operating system
 - b. The processor
 - c. The compiler
 - d. The interpreter
3. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?
 - a. The operating system
 - b. The processor
 - c. The compiler
 - d. The interpreter
4. What is the name of the process that a computer uses to execute a program written in a high-level language?
 - a. The operating system
 - b. The processor
 - c. The compiler
 - d. The interpreter
5. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?
 - a. The operating system
 - b. The processor
 - c. The compiler
 - d. The interpreter
6. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?
 - a. The operating system
 - b. The processor
 - c. The compiler
 - d. The interpreter
7. What is the name of the process that a computer uses to execute a program written in a high-level language?
 - a. The operating system
 - b. The processor
 - c. The compiler
 - d. The interpreter
8. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

9. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

10. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

11. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

12. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

13. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

14. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

15. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor

- c. The compiler
- d. The interpreter

16. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

17. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

18. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

19. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

20. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

21. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

22. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

23. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

24. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

25. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

1. What is the name of the process that a computer uses to execute a program?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

2. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

3. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

4. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

5. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

6. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

7. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

8. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

9. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

10. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

11. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

12. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor

- c. The compiler
- d. The interpreter

13. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

14. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

15. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

16. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

17. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

18. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

19. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

20. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

21. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

22. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

23. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

24. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

25. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

1. What is the name of the process that a computer uses to execute a program?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

2. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

3. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

4. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

5. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

6. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

7. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

8. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

9. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor

- c. The compiler
- d. The interpreter

10. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

11. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

12. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

13. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

14. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

15. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

16. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

17. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

18. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

19. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

20. What is the name of the process that a computer uses to manage its resources and the resources of the programs it is running?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

21. What is the name of the process that a computer uses to translate a program written in a high-level language into a form that can be executed by the processor?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

22. What is the name of the process that a computer uses to execute a program written in a high-level language?

- a. The operating system
- b. The processor
- c. The compiler
- d. The interpreter

23. What is the name of the process that a computer uses to manage
